GESing Sub-Provincial Population in B.C.

Population estimates play an important role in the allocation of resources. As well, population estimates underlie the effective derivation and analysis of key demographic and social statistics—e.g., labour market measures, crime rates, etc. Knowledge of population growth and where it occurs is vital to both planning and analytical processes.

Statistics Canada produces, on a quarterly basis, the official population estimates at the Canadian, provincial and territorial levels. Each November, Statistics Canada releases third-quarter estimates (as at July 1), which represent the mid-point annual population. Several provincial and territorial statistical agencies, including BC Stats, take the next step and develop sub-provincial population estimates.

A Made in B.C. Approach

Population statistics and analysis is one of the core functions of BC Stats as the central statistics agency for the Government of British Columbia. BC Stats has been producing sub-provincial population estimates for British Columbia since 1978. In December, BC Stats will be releasing 2009 municipal and regional district total population estimates for British Columbia: for 190 municipalities and unincorporated areas, 29 regional districts and eight development regions¹. These estimates are consistent in

aggregate with the Statistics Canada produced annual (July 1) provincial level population. As well, population estimates are produced for special geographies—e.g., RCMP Respondent Code Areas and Provincial Electoral Districts.

This 'made in B.C. approach' to population estimation is both innovative and cost-effective. Estimates production is accomplished in less than three months and, compared to the cost of undertaking a census, the approach is extremely cost effective.

GES—A Synopsis of the Methodology

The Generalized Estimation System (GES) refers to the procedures and methods by which current British Columbia small area population estimates are prepared. The approach employed in GES relies upon the use of administrative data sources—i.e., symptomatic indicators—that act as proxies of population change. The two indicators used are:

1. Residential electrical connections as at July 1 of each year; and
2. Health care registrants as at July 1 of each year.

GES employs two analytical methods (Difference-Correlation and Proportional Allocation) that relate past changes in regional populations to changes in the indicators symptomatic of population change. Two approaches are used because research has shown that for smaller geographies (with population of less than 4,000), more accurate

¹ The annual production of municipal and regional district population estimates is funded by Local Government, Ministry of Community and Rural Development.

estimates result when using a Proportional Allocation-based approach as opposed to the regression-based approach.

Difference-Correlation Method

The primary method by which population change is estimated is known as Difference-Correlation. This regression approach examines temporal changes (i.e., changes over time) in the symptomatic indicators and their correlation with known changes in populations; from this relationship regression coefficients are derived—in essence a type of average over time and/or across regions. Then, this “average” past relationship between the difference in indicator shares and the difference in population shares is applied to the present. The Difference-Correlation method is used to estimate the population for larger areas, typically with populations over 4,000, which represent 97% of the provincial population.

Proportional Allocation Method

The secondary method is referred to as the Proportional Allocation method. Unlike the regression approach employed in Difference-Correlation, the Proportional Allocation method uses a fixed (in time and place) share approach. It takes the relationship between the ratio of symptomatic indicator and population at a previous point in time, for a given place, and applies this relationship to the present. Proportional Allocation is used to estimate approximately 3% of the provincial population—i.e., areas with population of less than 4,000.

Estimates Quality

An evaluation of the sub-provincial population estimation methodology is necessary to ensure that the information output is relevant and reliable for users. Periodic evaluation assesses the accuracy of estimates and helps illuminate

the magnitude and nature of estimation error. This gives users more complete information to enable better utilization of the estimates, and provides BC Stats an analytical feedback mechanism to aid the improvement of future estimates. Error measurement is only possible when actual figures are available to compare with the estimates: the availability of a census every five years makes evaluation possible².

The accuracy of the population estimates depends largely on the quality, consistency and relevance of the symptomatic indicators used in the model. Over the last thirty years, different indicators have been incorporated in, and dropped from, the model reflecting an approach of continuous improvement in population estimation at BC Stats.

BC Stats' sub-provincial estimates are recognized in B.C. as the official population estimates. The quality of B.C.'s sub-provincial estimates has also been recognized by Statistics Canada, which has incorporated BC Stats' municipal estimates growth rate information as its own in publications³ for several years. As well, starting in 2008, BC Stats (along with Quebec and Northwest Territories) began supplying municipal population estimates to Statistics Canada, which will become Statistics Canada's official sub-provincial estimates for the province⁴.

Population estimates information is available on the BC Stats web site at the following link: <http://www.bcstats.gov.bc.ca>.

² An updated GES methodology document, including an evaluation based on results from the 2006 census will be available in early 2010.

³ Statistics Canada. 2008. *Annual Demographic Estimates: Census Metropolitan Areas, Economic Regions and Census Divisions, Age and Sex*. pp 135. Statistics Canada Catalogue no. 91-214-X. Ottawa.

⁴ Sub-provincial estimates for the remaining eight provinces and two territories will be derived by Statistics Canada through a micro-simulation approach.

Notes

Whenever possible we use **seasonally adjusted** data which removes normal seasonal variations to reveal the underlying trends in the data. Adjusted data are identified as Seasonally Adjusted or SA.

Some series subject to irregular fluctuations are presented on a **three month moving average** basis. All such series included in this report are also seasonally adjusted. Where space is limited these are tagged 3MMA SA.

Series not labeled as seasonally adjusted are unadjusted or raw. Some unadjusted series in this report are explicitly identified as such.
